

# P2 Topic 4 Revision tracker

## PHYSICS

Learning objectives I can:	I can do this very well	I can do this quite well	I need to do more work on this
<b>4.1</b> Recall that the stopping distance of a vehicle is made up of the sum of the thinking distance and the braking distance			
<b>4.2</b> Demonstrate an understanding of the factors affecting the stopping distance of a vehicle, including			
<b>a</b> the mass of the vehicle			
<b>b</b> the speed of the vehicle			
<b>c</b> the driver's reaction time			
<b>d</b> the state of the vehicle's brakes			
<b>e</b> the state of the road			
<b>f</b> the amount of friction between the tyre and the road surface			
<b>HSW 13</b> Explain how and why decisions about uses of science and technology are made			
<b>4.3</b> Investigate the forces required to slide blocks along different surfaces, with differing amounts of friction			
<b>4.4</b> Use the equation: momentum = mass × velocity (kilogram metre per second, kg m/s)      (kilogram, kg)      (metre per second, m/s) to calculate the momentum of a moving object			
<b>4.5</b> Demonstrate an understanding of momentum as a vector quantity			
<b>4.6</b> Demonstrate an understanding of the idea of linear momentum conservation			
<b>HSW 10</b> Use qualitative and quantitative approaches when presenting scientific ideas and arguments, and recording observations			
<b>4.8</b> Investigate how crumple zones can be used to reduce the forces in collisions			
<b>4.7</b> Demonstrate an understanding of the idea of rate of change of momentum to explain protective features including bubble wraps, seat belts, crumple zones and air bags			
<b>H 4.9</b> Use the equation: force (newton, N) = $\frac{\text{change in momentum}}{\text{time}}$ (kilogram metre per second, kg m/s) (second, s)  $F = \frac{(mv - mu)}{t}$ to calculate the change in momentum of a system, as in 4.6			
<b>HSW 5</b> Plan to test a scientific idea, answer a scientific question, or solve a scientific problem by controlling relevant variables			
<b>4.10</b> Use the equation: work done = force × distance moved in the direction of the force (joule, J)      (newton, N)      (metre, m) $E = F \times d$			
<b>4.11</b> Demonstrate an understanding that energy transferred (joule, J) = work done (joule, J)			
<b>4.12</b> Recall that power is the rate of doing work and is measured in watts, W			
<b>4.13</b> Use the equation: power (watt, W) = $\frac{\text{work done}}{\text{time}}$ (joule, J)			

# P2 Topic 4 Revision tracker

$P = E / t$	time taken (second, s)				
<b>4.14</b> Recall that one watt is equal to one joule per second, J/s					
<b>H 4.18</b> Carry out calculations on work done to show the dependence of braking distance for a vehicle on initial velocity squared (work done to bring a vehicle to rest equals its initial kinetic energy)					
<b>4.15</b> Use the equation:					
gravitational potential energy (joule, J)	= mass (kilogram, kg)	x	gravitational field strength (newton per kilogram, N/kg)	x	vertical height (metre, m)
$GPE = m \times g \times h$					
<b>4.16</b> Use the equation:					
kinetic energy (joule, J)	= $\frac{1}{2}$ x	mass (kilogram, kg)	x	velocity <sup>2</sup> (metre/second) <sup>2</sup> , (m/s) <sup>2</sup>	
$KE = \frac{1}{2} \times m \times v^2$					
<b>4.17</b> Demonstrate an understanding of the idea of conservation of energy in various energy transfers					
<b>H 4.18</b> Carry out calculations on work done to show the dependence on braking distance for a vehicle on initial velocity squared (work done to bring a vehicle to rest equals its initial kinetic energy)					
<b>HSW 11</b> Present information using scientific conventions and symbols
